

# Moderator script — Protocol B · Accessibility experts

---

**30 min · moderated · screen share · think-aloud** Covers RQ2 (friction) and RQ4 (content validity). **Not a source of RQ3 comprehension data** — experts already know what Unknown means, so their answers can't tell you whether a target user understands it. Full rationale: [layers-session.md](#) Session 3.

**Before you start:** Flask running? `curl 127.0.0.1:5001`. Recording on. Capture sheet open. Rule list ready to show at probe 5.

---

## 0–3 · Setup

Read aloud:

"Thanks for doing this. This is a proof of concept I built — I'm testing it, not you. I'm after two things: where the interface gets in your way, and whether the findings are actually right. Please be blunt about the second one.

Think out loud as much as you can. And it only evaluates buttons — deliberate limit, not something you've missed."

Confirm recording consent.

---

## 3–6 · Current practice

Brief — this calibrates their later answers, it isn't a research question.

"When you audit a component today, what do you actually use?" "What does a finding have to include before you'd act on it?"

 **Hard stop at 6:00.** This is the block most likely to overrun.

---

## 6–15 · RQ2 · Task, unaided

Hand over screen control. Say only:

"Find out whether this button is accessible enough to ship."

Do not mention the panel. **No help for the first 90 seconds of any stall.**

They'll finish faster than engineers — that's expected. **What matters is where an expert hesitates anyway.** Subject-matter confusion is ruled out by who they are, so any stall here is a pure interface problem. This is your cleanest RQ2 signal in the whole study; capture it in detail even if it feels minor.

Watch for → capture sheet:

- Did they find the panel trigger unaided? How long?
- Did they run DoubleCheck without being told it exists?

- Every hesitation + what was on screen
  - Anything they expected to find and couldn't
- 

## 15–27 · RQ4 · Content validity

Walk **three or four findings** — include at least one Fail and one Unknown.

Per finding:

1. "Is this finding correct?"
2. "Is the evidence it gives sufficient to justify that verdict?"
3. "Is the recommended fix what you'd advise?"

Then:

4. **"Anything it should have caught and didn't?"** ← the most important question in this protocol.  
False negatives matter far more than false positives for a tool claiming ship-readiness. Ask it even if you're running late.
  5. (*show the nine-rule list*) "Are these the right nine? What's missing?"
  6. "Would you trust this in a review? What would have to change first?"
- 

## 27–30 · Close

"Is there anything I haven't asked that would help me understand this better?"

Thank them. Stop recording.
